

## ADOBE FLEX FILE MANAGER COMPONENT

**Description:** Similar to Microsoft Windows Explorer in function, the File Manager allows a user to perform file management tasks such as creating, deleting and updating files and directories, setting the access control (read, write or execute) permissions on the files and directories, moving them around and renaming them.

**Technology:** The File Manager Component is developed using Adobe Flex 3.0. It is built and distributed as a library module (i.e. a swc file). It can be included and integrated into any Flex or ActionScript application. It leverages loosely coupled data binding techniques and so can bind with data from any of the server side technologies. It can be extended to add additional behavior and presentation styles, if desired.

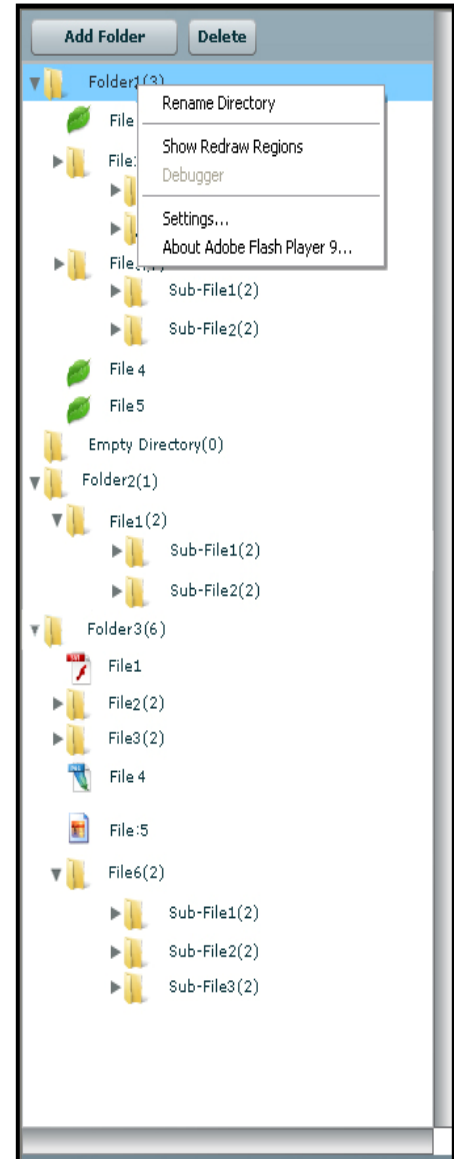

**Functionality:** It provides the entire gamut of features that Windows Explorer provides. Some of these features are as follows:

- Display directories and files in a hierarchical tree
- Expand and close a directory node by double clicking
- Add/Delete/Rename directories and files
- Display custom icons depending on file type
- Move files from one directory to the other
- Drag and Drop directories and files into other directories
- Choose a directory and file and right-click to access shortcuts
- Open a directory or file by double clicking on it
- Drag and Drop files into the File Manager component
- Rename directories and files to have names of arbitrary lengths

### Application Scenarios:

- Document viewer where documents/ files need to be listed in multiple nested hierarchical levels
- Enhanced tree rendering of reports, files or any other application elements
- Display of grouped data. As an example, Ticker or Symbol look up where symbols are grouped at multiple levels such as US Equities listing on NYSE and Technology stocks
- Navigation widget for traversing through an application
